

1. Git Commands

Task	Command
Initialize a repository	<code>git init</code>
Stage all files	<code>git add .</code>
Commit with a message	<code>git commit -m "Initial commit"</code>
Push to remote	<code>git push origin main</code>
Pull latest changes	<code>git pull origin main</code>

2. Difference Between `git fetch` and `git pull`

- **git fetch** downloads the latest changes from the remote repository but does not merge them into your local branch.
 - **git pull** downloads the latest changes and automatically merges them into your current local branch.
-

3. Create a New GitHub Repository and Share the Link

I cannot create a repository on your GitHub account or share a real repository link because I do not have access to your account.

You can create one using these steps:

```
git init
echo "Hello GitHub" > sample.txt
git add .
git commit -m "First commit"
git branch -M main
git remote add origin https://github.com/YOUR_USERNAME/repository-name.git
git push -u origin main
```

After pushing, your repository link will look like:

https://github.com/YOUR_USERNAME/repository-name

4. Difference Between a Fork and a Pull Request

- A **Fork** is a personal copy of someone else's repository in your GitHub account.
 - A **Pull Request (PR)** is a request to merge your changes into another repository or branch.
-

5. Create a Branch feature-test, Commit, and Merge Back to Main

Create and switch to a new branch

```
git checkout -b feature-test
```

Make changes to a file

```
echo "New feature added" >> sample.txt
```

Stage and commit changes

```
git add .
```

```
git commit -m "Added feature test"
```

Switch back to main branch

```
git checkout main
```

Merge feature-test into main

```
git merge feature-test
```
